

AfiShepherd

AfiShepherd for Traditional Small-Scale Farms

A comprehensive solution for small scale farms:

- Milking parlor for effective and hygienic milking
- Electronic system for improved animal monitoring
- Computerized system for planning production procedures
- Complete system gives farmers more free time

As part of a global trend, sheep and goat farmers are establishing dairy units within their farms. These units produce and process their own milk for dainty dairy products.

The need for high levels of hygiene and proper production management has prompted small dairy farmers to incorporate mini-milking parlors. Equipped with the latest technology in animal monitoring, mini-milking parlors include AfiShepherd health and production management systems. These systems enable farmers to devote more time to their dairy processing plants, their families, and in many cases their own "Agrotourism" operations.

AfiShepherd systems help plan and manage production in the dairy processing plant according to milk availability. Mini-milking parlors on small farm installations can also be outfitted with AfiShepherd electronic ID and milk measurement systems, as well as software that collects and analyzes data for better management. The result: higher yields, more economical production and increased profits for the farm.

Mini-milking operations consist of four to ten milking stalls with a milking ramp for eight to twenty animals. As the technology is available in a "pre-installed" version, the farmer needs only to position the system, connect it to the water and power supplies, and watch it get down to work.

The mini-milking parlor brings small farmers to the cutting edge of the industry, boosting efficiency in their day-to-day operations.
